What's the difference between Low & High Density?

Low Density

Low density trash bags are thick, flexible and highly resistant to puncturing and tearing.

- ★ Ideal for maintenance areas, outside even kitchens – wherever sharp waste will be discarded
- ★ Designed to stretch and cling to the waste
- ★ If the trash contents poke a hole in the bag, the bag will not rip open and spill trash all over

High Density

High density are thinner and not as puncture resistant. However, they can still carry very heavy loads that are not rough-edged such as clothing, towels and dirt.

- ★ Super strong if you are not throwing away sharp objects
- ★ Can handle heat up to 212 degrees
- ★ Designed to handle some weight without stretching
- ★ Great for office areas, bathrooms, laundry, classrooms, etc
